

Attendance

I would also change “**Analytics Summary**” → “**Attendance Summary**” because it immediately tells the user what the figures represent. And I'd avoid wording such as “*Present is clearly ahead*” and “*2.8× the size of Late*”—that sounds like a competition rather than an HR/attendance report.

Attendance

Summary

This week, an average of 16 employees were scheduled per day. Of these, 11 (69%) were **Present**, 4 (25%) were **Late**, and 1 (6%) was **Absent**. Absences can be further classified as **Sickness Absence**, **Authorised Absence**, or **Unauthorised Absence**, where applicable.

Employees

For this card, I'd recommend “**Workforce Demographics**” or, if the card is specifically limited to gender, “**Gender Distribution**” rather than the generic “**Analytics Summary**.”

Recommended version

✦ Gender Distribution

Across the workforce of 20 employees, 12 (60%) are Male, 6 (30%) are Female, and 2 (10%) are recorded as Other. Male employees represent the largest proportion of the workforce at 60%, followed by Female employees at 30% and Other at 10%.

SICKNESS

For this card, the best term is “Sickness Absence by Clinical Category” rather than the generic “Analytics Summary.” It immediately tells the user both what is being measured and how it is grouped.

Recommended version

✦ **Sickness Absence by Clinical Category**

Over the last 12 months, 61 sickness absence days were recorded. **Mental Health** accounted for 25 days (41%), **Other** for 20 days (33%), and **Musculoskeletal** conditions for 16 days (26%). Mental Health was the largest contributor to sickness absence, accounting for 41% of all recorded sick days.

If you want a **shorter dashboard heading**, “**Sickness Absence Breakdown**” would also work very well.

Priorities

For this card, I recommend replacing “Analytics Summary” with “HR Action Items by Severity”.

It fits particularly well because the data is specifically showing open HR actions grouped by Warning, Critical, and Info severity levels.

Recommended wording

✦ HR Action Items by Severity

There are currently 56 open HR action items. Of these, 25 (45%) are Warning, 18 (32%) are Critical, and 13 (23%) are Info. Warning items represent the largest proportion of open actions, followed by Critical and Info items.

My preferred navigation would therefore be:

Employees | Attendance | Sickness | HR Actions | Events | Resourcing | Engagement

Please change priorities to HR Actions

Events

For this card, I recommend replacing "Analytics Summary" with "Upcoming Events Summary."

Recommended wording

✦ Upcoming Events Summary

Over the next 7 days, there are **3 upcoming events: 2 Anniversaries (67%) and 1 Meeting (33%)**. Anniversaries account for the majority of scheduled events during this period.

Resourcing

For this card, I recommend replacing “Analytics Summary” with “Hiring Demand Summary”.

The card is showing **where current recruitment demand sits across different business areas**, based on open roles. “Hiring Demand” therefore describes the insight more accurately than generic “Analytics.”

Recommended version

✦ Hiring Demand Summary

There are currently **6 open roles** across the organisation. **Engineering & Platform** accounts for 3 roles (50%), **Other** for 2 (33%), and **Customer Experience** for 1 (17%). Engineering & Platform currently represents the largest share of hiring demand.

Engagement

For this card, I recommend replacing “Analytics Summary” with “Employee Engagement Summary.”

That best matches the content because the card is summarising department-level engagement scores and the overall company engagement score from the latest survey.

Recommended version

✦ Employee Engagement Summary

The latest employee engagement survey shows a company-wide score of 84/100. Engineering recorded the highest departmental score at 87, followed by HR at 86 and Operations at 82.
